Product Piping

Features

Advantages

Benefits

Valve Handle
Extensions

Positions valve handle out from under trailer, eliminates pinch-points and makes it more comfortable to operate the valve.

Promotes driver safety and reduces the potential for injuries.

Long Lever
Handles

Long lever handles, combined with thinnest wafer disc available, reduces resistance (20ft/lbs.) making the valve easier to open and close.

Easier operation means less wear and tear on the driver and promotes complete closure of valve ensuring a better seal thereby reducing the potential for premature seat wear and leakage.

Aeration
Control Location

Standard easily accessible individual hopper aeration controls are conveniently mounted outboard and below hot air line.

Provides better control of available air source, allowing the driver to direct more air to the hopper being unloaded. Especially useful for difficult to move materials.

Hot Air Line
Location

Tucked under and below the vessel framing to reducing the potential for the driver to come in contact with the hot pipe.

Promotes driver safety and reduces the potential for injuries.
